Definition / Concept

- ▶ What is a Digital Twin?
 - ▶ what are its main features?
 - ▶ and its required components?
- ▶ Let's ask someone informed...

An answer - ChatGPT

Good morning, what is a digital twin?

Good morning! A **digital twin** is a virtual representation of a physical object, system, or process that is continuously updated with real-time data. It mirrors the physical counterpart as accurately as possible and is used to monitor performance, predict outcomes, and support decision-making.

Key features of a digital twin:

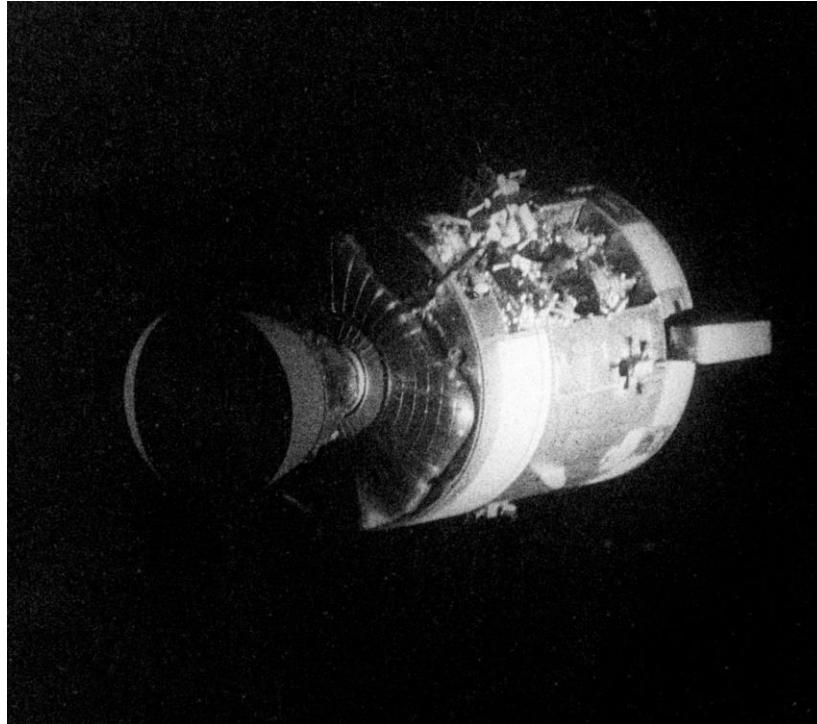

- **Real-time data:** It uses sensors or other data sources to stay in sync with the physical version.
 - **Simulation:** It can simulate different scenarios to predict how changes will affect performance or behavior.
 - **Analytics:** Uses AI and machine learning to analyze data and generate insights.
 - **Lifecycle integration:** It can track the full lifecycle of a product—from design to operation and maintenance.
- Gemini, Copilot, DeepSeek, and [Wikipedia](#) provide very similar answers.

A brief history of Digital Twins

► The Apollo 13 Mission (1970)

The Apollo 13 Mission

- The very first twins?

- but synchronization was performed manually.

First definitions of a Digital Twin

- ▶ The concept was first established by M. Grieves:
 - ▶ within a course on *Product Lyfecycle Management* in the Univ. of Michigan (2003)
 - ▶ though instead of DT, he used the term *Mirrored Spaces Model* ☺
- ▶ The first definition comes from M. Shafto et al:

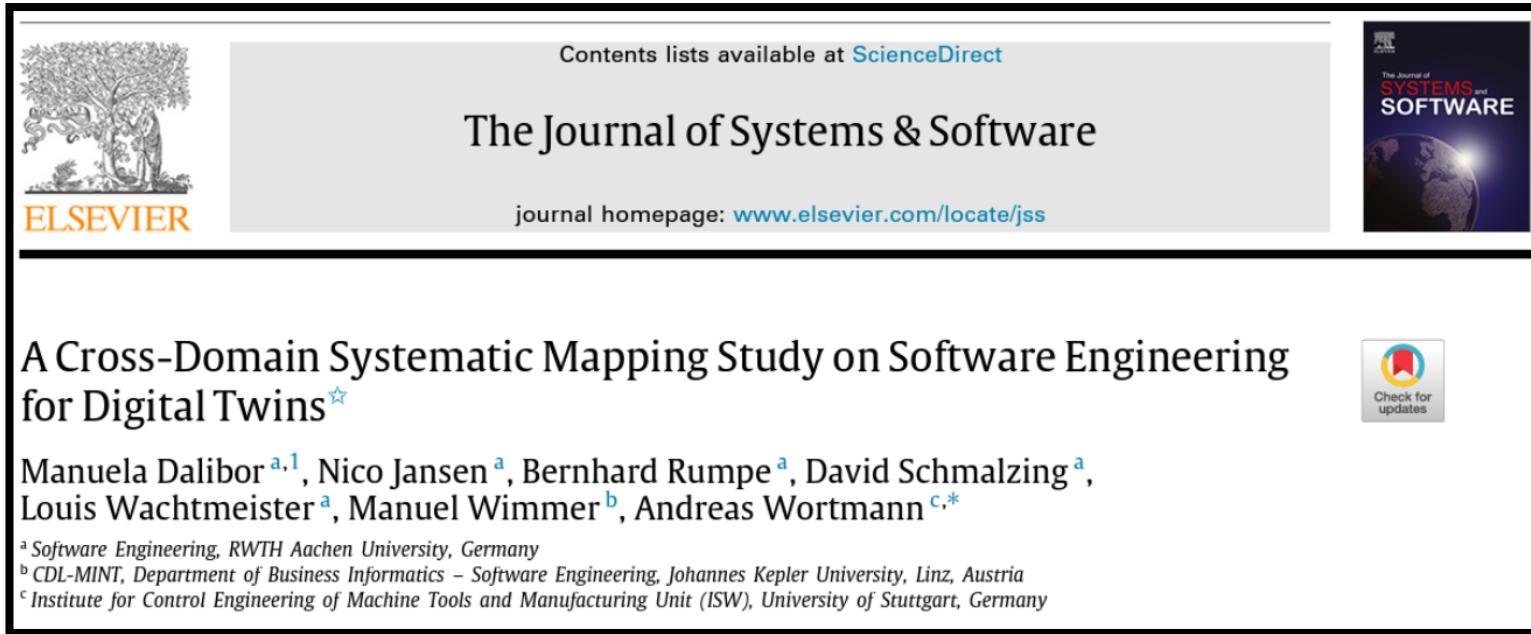

A **digital twin** is an integrated multi-physics, multi-scale, probabilistic simulation of a vehicle or system that uses the best available physical models, sensor updates, fleet history, etc., to mirror the life of its flying twin.

*Modeling, Simulation, Information Technology & Processing Roadmap
National Aeronautics and Space Administration (2012)*
- ▶ A more general definition appeared in a later paper by M. Grieves:

A **digital twin** is a virtual representation of what has been produced.

*Digital Twin: Manufacturing excellence through virtual factory replication
Florida Institute of Technology, White Paper (2014)*

... but there are many more

The image shows the front cover of a journal issue. At the top left is the Elsevier logo, featuring a tree and the word "ELSEVIER". To the right of the logo is the journal title "The Journal of Systems & Software" and the subtitle "Contents lists available at ScienceDirect". Below the title is the journal homepage URL "journal homepage: www.elsevier.com/locate/jss". To the right of the title is a small thumbnail image of the journal cover, which features a globe and the journal title. In the center of the cover is the title of the article: "A Cross-Domain Systematic Mapping Study on Software Engineering for Digital Twins". Below the title are the names of the authors: Manuela Dalibor, Nico Jansen, Bernhard Rümpe, David Schmalzing, Louis Wachtmeister, Manuel Wimmer, and Andreas Wortmann. To the right of the author names is a "Check for updates" button. At the bottom of the cover are three small footnotes: ^a Software Engineering, RWTH Aachen University, Germany; ^b CDL-MINT, Department of Business Informatics – Software Engineering, Johannes Kepler University, Linz, Austria; and ^c Institute for Control Engineering of Machine Tools and Manufacturing Unit (ISW), University of Stuttgart, Germany.

356 papers
reviewed

112 definitions
of the term
“Digital twin”

Several of these definitions

- ▶ Some of them are too vague:
 - ▶ Digital equivalent to a physical product.
 - ▶ Simulation method that can be used for evaluation and optimization.
 - ▶ Model-based representation of entities of the real world such as machines, cars, or persons.
 - ▶ Simplified numerical model.
- ▶ Some of them are specific of a certain domain:
 - ▶ Virtual replica of the printing hardware.
 - ▶ Set of virtual information that fully describes a potential or actual physical production from the micro atomic level to the macro geometrical level.
 - ▶ Virtual model of the physical plant.
 - ▶ Software model composed of 3D physical, mechanical, and electrical data along with detailed information about its assembly process and instructions on production.

Definition of the DT Consortium

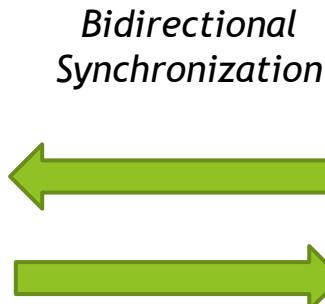

A digital twin is an integrated data-driven virtual representation of real-world entities and processes, with synchronized interaction at a specified frequency and fidelity.

Digital Twin Consortium, [Glossary of digital twins](#) (2021)

Physical Twin

Digital Twin

To sum up

- ▶ A Digital Twin is either a **fill the gap** of its physical (PT) counterpart?
 - ✓ model
 - ✓ simulator
 - ✓ dashboard
 - ✓ control loop
 - ✓ prediction system
 - ✓ machine learning (ML) system
- ▶ Yes (to all) but:
 - ✓ the physical twin could be any physical entity, but also a process, a software system, etc.
 - ✓ there is a synchronous and automated feedback loop communication between both twins.
- ▶ A **Digital Twin System** is a pair of coupled physical/digital twins.

Properties of Digital Twin Systems

- ▶ Representativeness & Contextualization
 - ▶ the DT must mimic the status of the PT, considering only the features that are relevant to the context.
- ▶ Reflection
 - ▶ the PT is timely and univocally represented by the attributes, status, and behavior of its DT.
- ▶ Entanglement
 - ▶ the information representing the PT must be received in (close to) real-time by the DT.
- ▶ Predictability
 - ▶ the DT may be used to simulate the behaviour of the PT to determine the outcomes in a likely future or context.

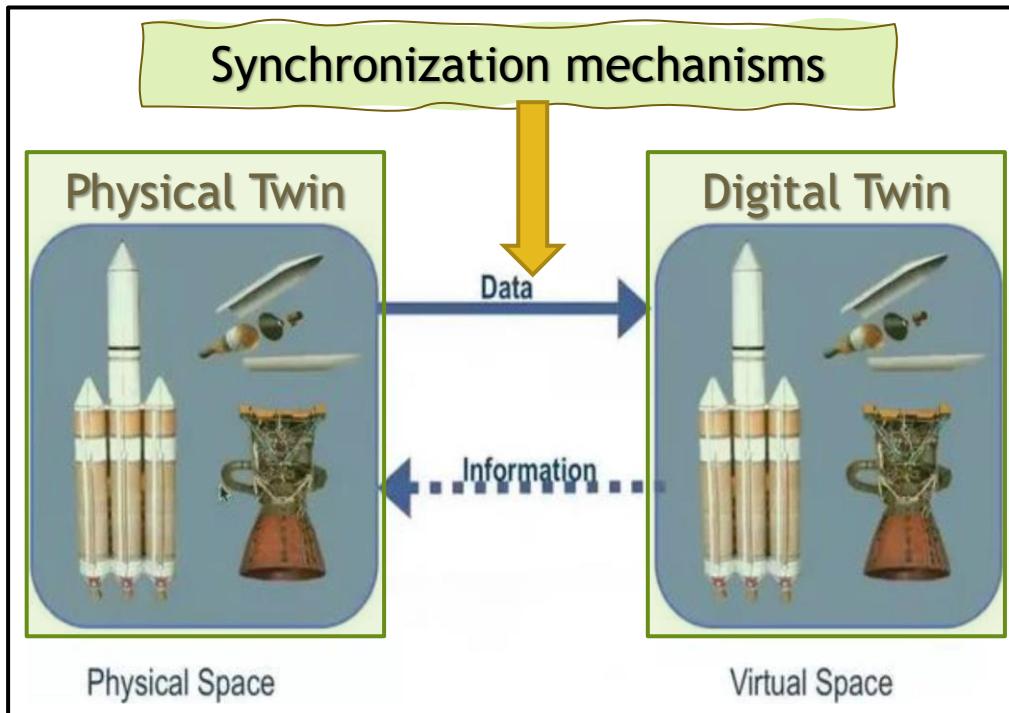

Properties of Digital Twin Systems (2)

- ▶ Persistency
 - ▶ the DT maintains a continuously updated and accurate virtual representation of the PT over time.
- ▶ Memorization
 - ▶ the DT must store all meaningful past and present data and the context in which they originated for later analysis.
- ▶ Replication
 - ▶ DTs may replicate the PT in different contexts, each replica addressing specific characteristics
- ▶ Composability
 - ▶ DTs can be composed so that both the individual and composed objects can be observed and controlled.
- ▶ Manageability
 - ▶ the DT enhances the PT by an API that facilitates its management, which also allows to deal with damages or problems of both PT/DT.

Fields of application

- ▶ Digital Twins can be used in virtually any field:
 - ▶ Manufacturing: Monitor machinery for predictive maintenance.
 - ▶ Smart cities: Model traffic flow, infrastructures, or energy use.
 - ▶ Healthcare: Simulate patient health scenarios.
 - ▶ Aerospace & automotive: Test performance or design changes.

Some Applications

- ▶ Smart Cities
 - ▶ Urban Digital Twins (UDTs)
 - ▶ Addressing issues such as:
 - ▶ Urban planning
 - ▶ City infrastructures
 - ▶ Traffic
 - ▶ Energy consumption

N. Mohammadi and J. E. Taylor, "Smart city digital twins," 2017 IEEE Symposium Series on Computational Intelligence (SSCI), Honolulu, 2017, pp. 1-5, doi:10.1109/SSCI.2017.8285439.

Some Applications

- ▶ Healthcare
 - ▶ Addressing issues such as:
 - ▶ Developping personalized treatments
 - ▶ Drug discovery and development
 - ▶ Monitoring chronic disease healthdata
 - ▶ Organ-specific digital twins: heart, lung, kidney,...
 - ▶ Optimizing hospital operation and workflows
 - ▶ Training surgeons
 - ▶ Emergency response
 - ▶ Remote patient monitoring
 - ▶ Population health

Some Applications

- ▶ Information and Communication
 - ▶ Addressing issues such as:
 - ▶ Network infrastructures
 - ▶ Ericsson Site Digital Twin
 - ▶ Telecom sites
 - ▶ UE Hexa-X 6G project

R. Dong, et al., "Deep Learning for Hybrid 5G Services in Mobile Edge Computing Systems: Learn From a Digital Twin," in IEEE Trans. Wireless Communications, vol. 18, no. 10, pp. 4692-4707, Oct. 2019, doi: 10.1109/TWC.2019.2927312.

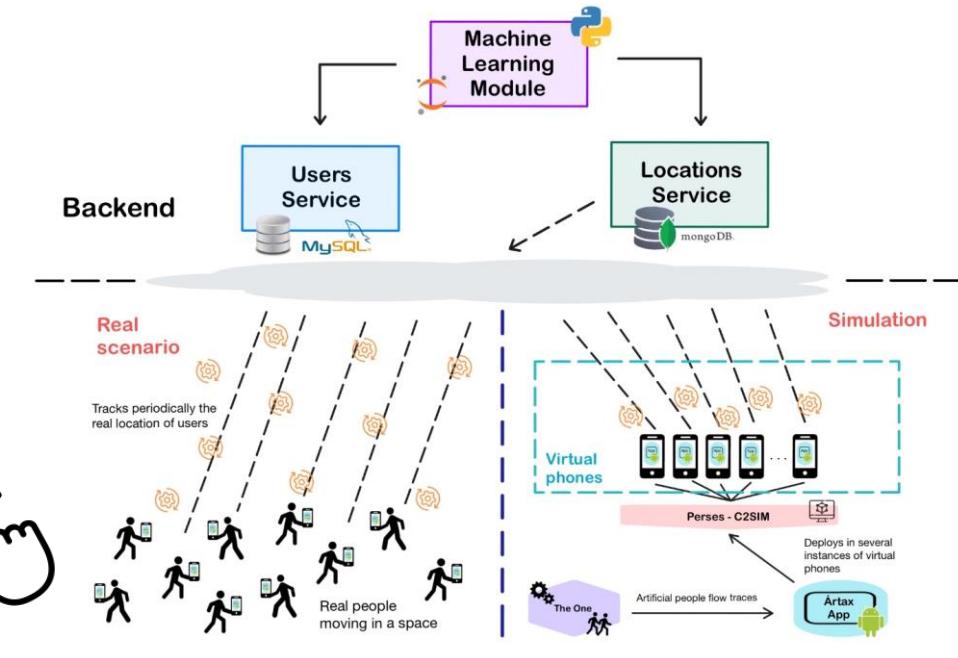

Some Applications

- ▶ Artax - a DT for people's movement in crowds
 - ▶ as part of the research project:
Including People in Smart City Applications
 - ▶ the phone builds a *Digital Avatar* of its owner
 - ▶ virtual profile with their habits, preferences, etc.
 - ▶ including their movements as a sequence of GPS positions
 - ▶ that can be served to third-parties on demand
- ▶ Individuals are considered as first-class entities of the DT
 - ▶ providing RT information from individuals in a specific area

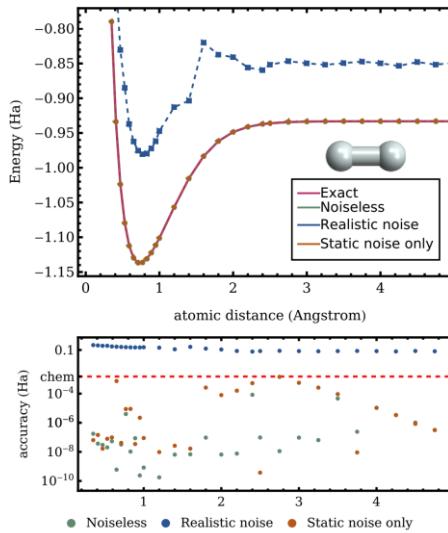

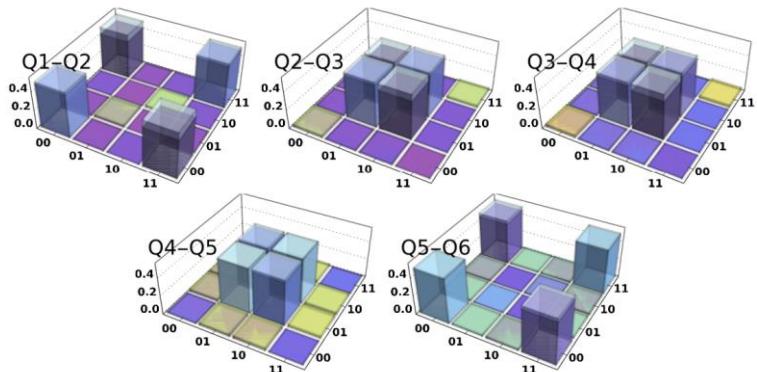

A. Perez-Vereda, R. Hervas, C. Canal. Digital Avatars: A programming framework for personalized human interactions through virtual profiles. *Pervasive and Mobile Computing*, 87:101718 (17 pp.), Elsevier, 2022.

I. Alba, J. Troya, C. Canal. Towards a Digital Twin System for Human Crowd Motion Prediction. *EDOC 2024. Lecture Notes in Business Information Processing*, vol 537. Springer (2025).

Some Applications

- ▶ A DT of Noisy Quantum Computers
 - ▶ parametric error model of transmon qubit devices
 - ▶ for understanding and mitigating noise in NISQ QPUs

C. Gustiani, T. Jones, S. C. Benjamin. The Virtual Quantum Device (VQD): A tool for detailed emulation of quantum computers. *Quantum* 9: 1642 (2025).

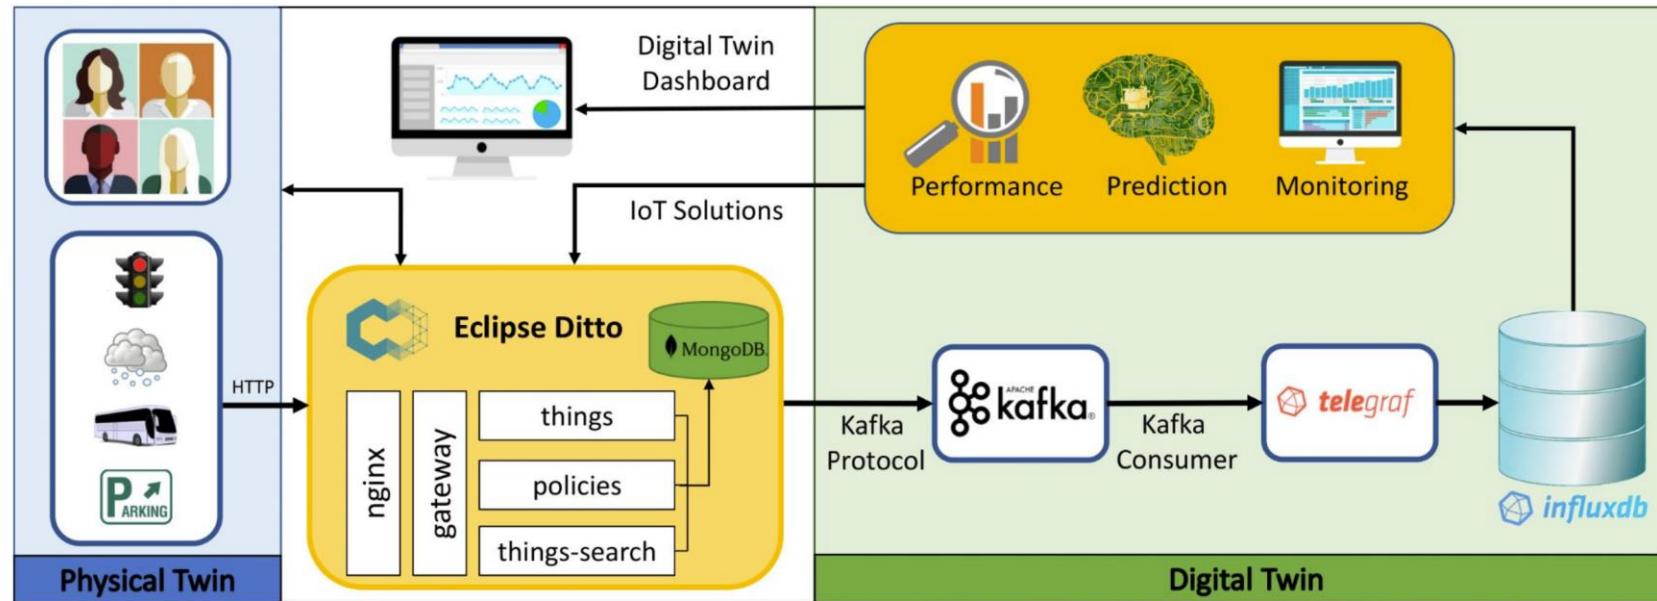

Research Challenges

- ▶ Many industrial initiatives for building DTs
 - ▶ developed in an *ad-hoc* manner
- ▶ Lack of Software Engineering methods in their development
 - ▶ standards
 - ▶ methodologies
 - ▶ frameworks & tools
 - ▶ data fusion & curation
 - ▶ interoperability, **composition & deployment**
 - ▶ **validation & evaluation**
- ▶ We find efforts in all these fields but not clear outcomes yet

A. Sharma, E. Kosasih, J. Zhang, A. Brintrup, A. Calinescu. Digital Twins: State of the art theory and practice, challenges, and open research questions, Journal of Industrial Information Integration, vol 30, 2022, 100383. <https://doi.org/10.1016/j.jii.2022.100383>.

Composition of DTs

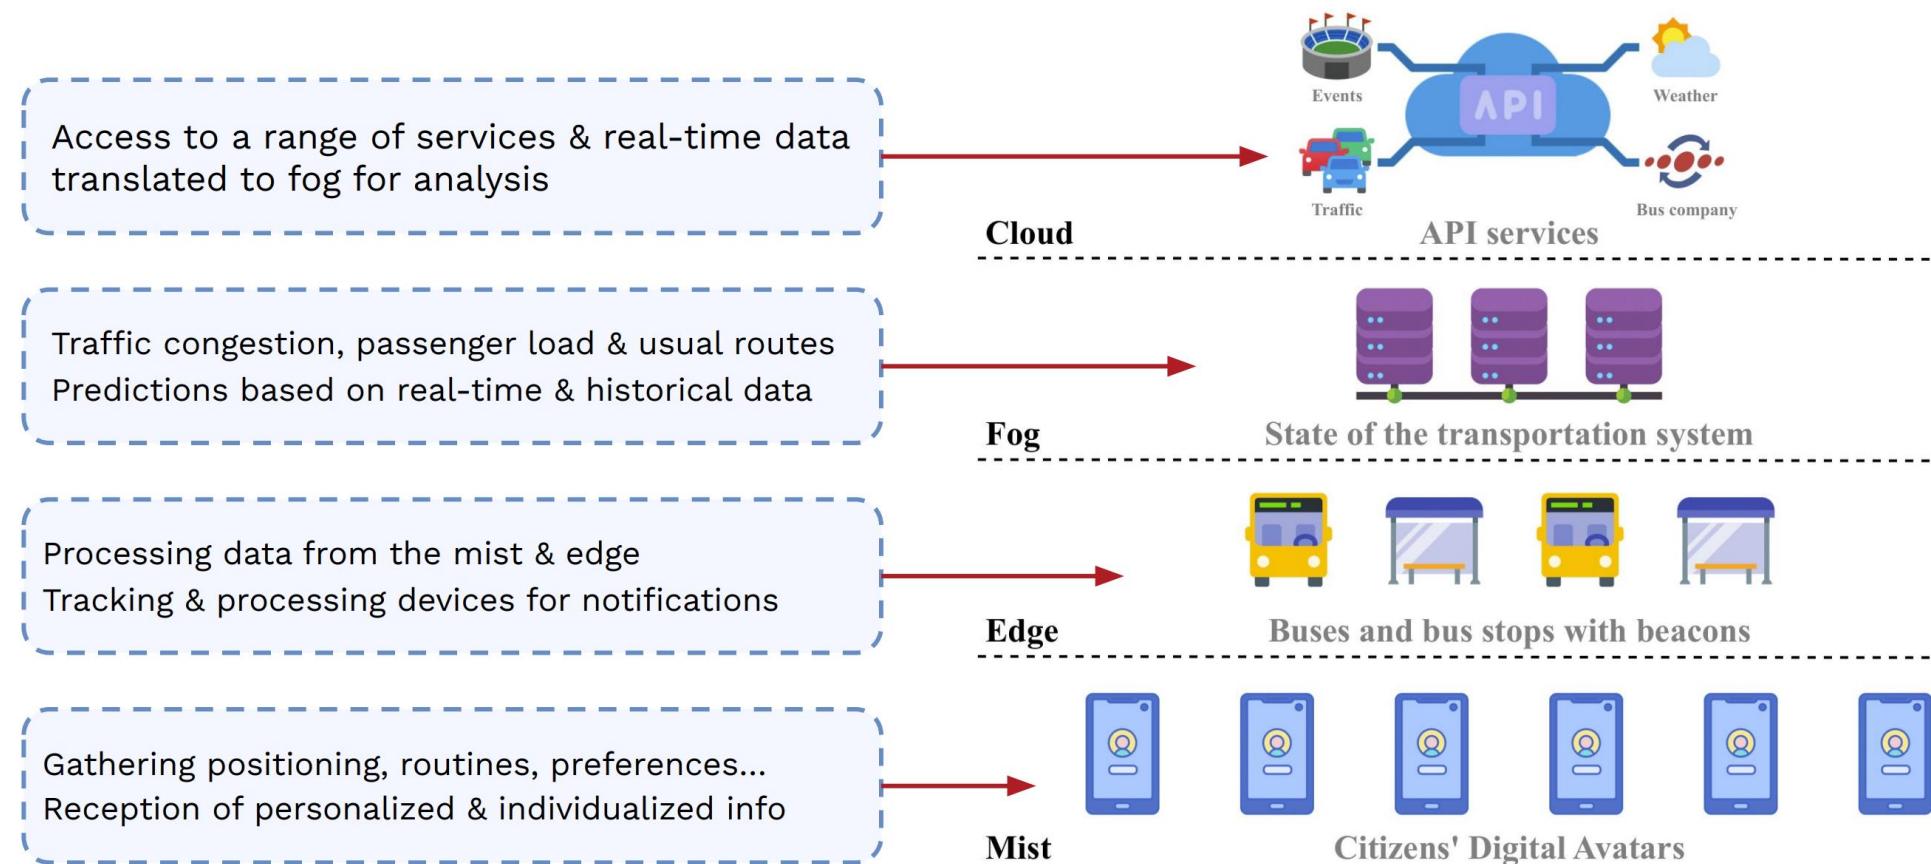

- ▶ Integration of citizens into UDTs through their Digital Avatars
- ▶ Case study: Public transportation system of the city of Malaga

R. García-Luque, L. Toro-Gálvez, N. Moreno, J. Troya, C. Canal and E. Pimentel. "Integrating Citizens' Avatars in Urban Digital Twins". Journal of Web Engineering, 22(06):913-938, Elsevier, 2023.

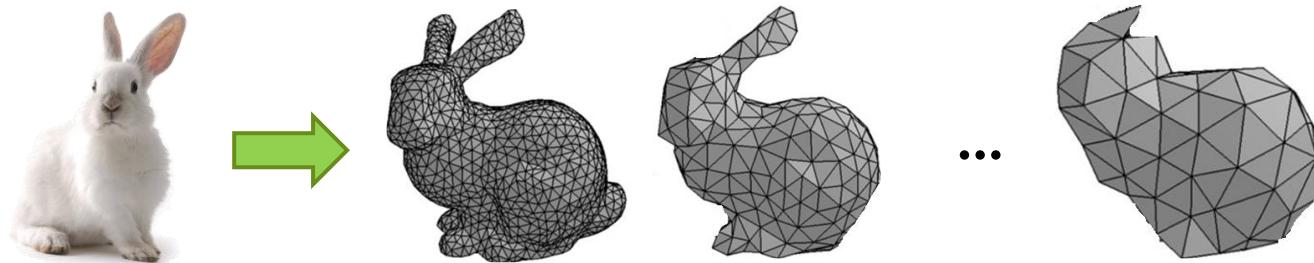

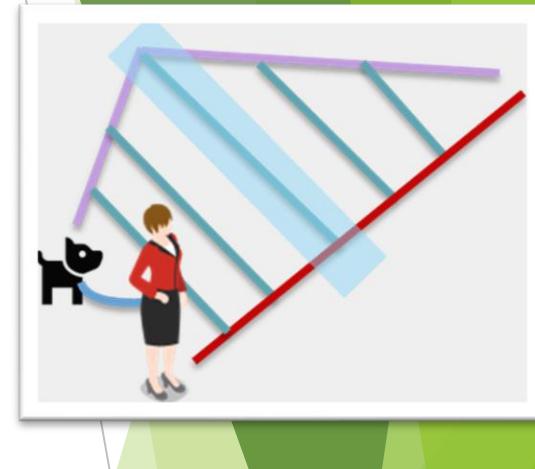

Deployment in the Cloud-to-IoT Continuum

S. Laso, L. Toro-Gálvez, J. Berrocal, J. Troya, C. Canal, J.M. Murillo. "Towards a Urban Digital Twins Continuum Architecture". Software Architecture. ECSA 2023 Tracks, Workshops, and Doctoral Symposium. ECSA 2023. LNCS, vol 14590. Springer (2024) https://doi.org/10.1007/978-3-031-66326-0_17

Validation and fidelity assessment

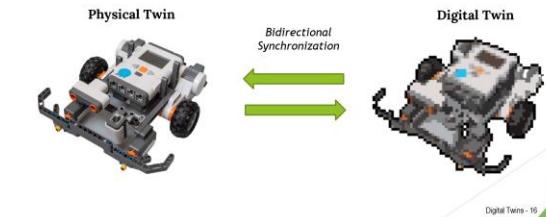

- ▶ How can we determine if a DT *accurately represents* its PT?
- ▶ How can we measure the *fidelity* between two models of the same system?
- ▶ **Fidelity:** the degree to which a model reproduces the actual state and behavior of a system in a measurable way.

Definition of the DT Consortium

A digital twin is an integrated data-driven virtual representation of real-world entities and processes, with synchronized interaction at a specified frequency and **fidelity**.

Digital Twin Consortium, *Glossary of digital twins* (2021)

Paula Muñoz. Measuring the Fidelity of Digital Twins using Trace Alignments.
PhD. thesis, University of Málaga (2025).

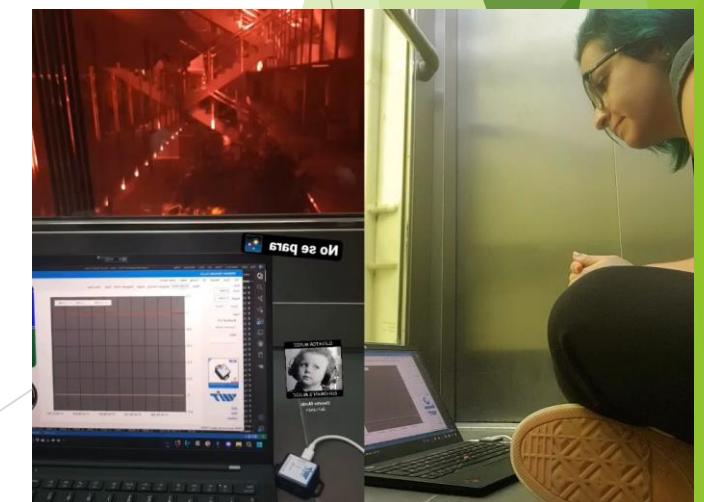

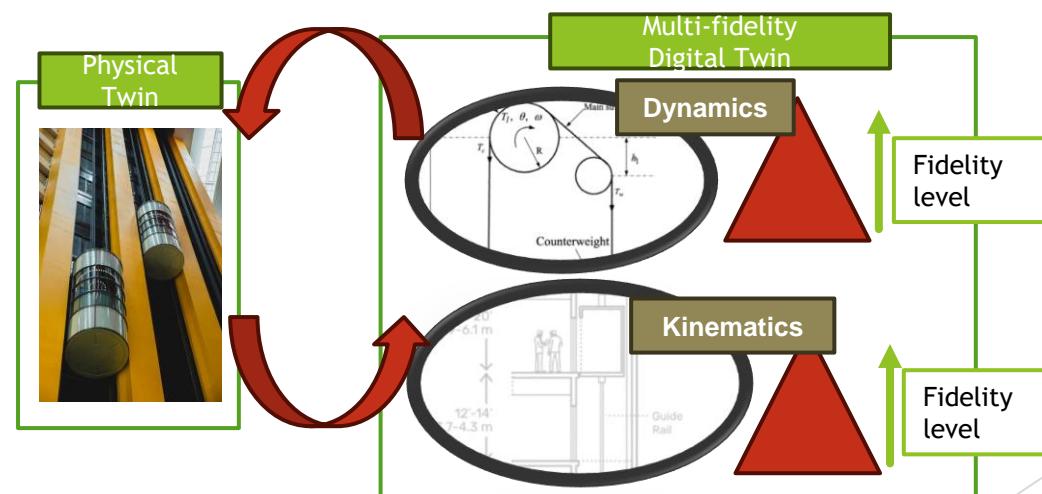

Validation and fidelity assessment

- ▶ Fidelity depends on the *purpose* of the DT
 - ▶ and it is related to *abstraction* and *resolution*
- ▶ Abstraction: process of selecting the essential aspects of a model, ignoring those that are not relevant for its purpose.
- ▶ Resolution: level of detail used to represent certain aspects of the real world in a model.

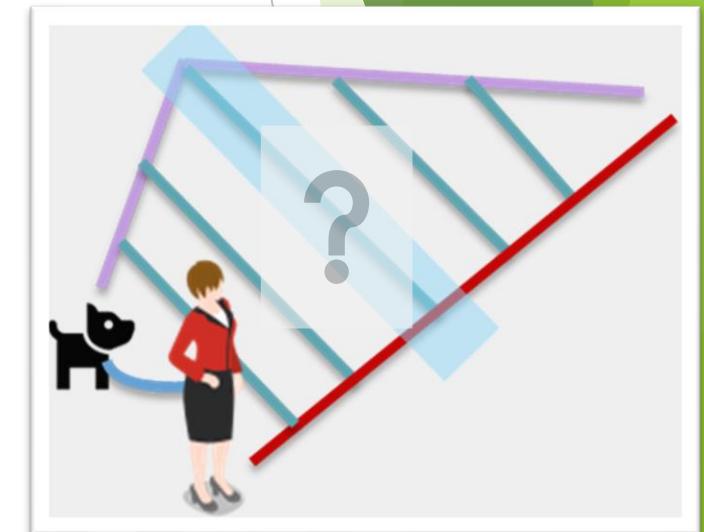

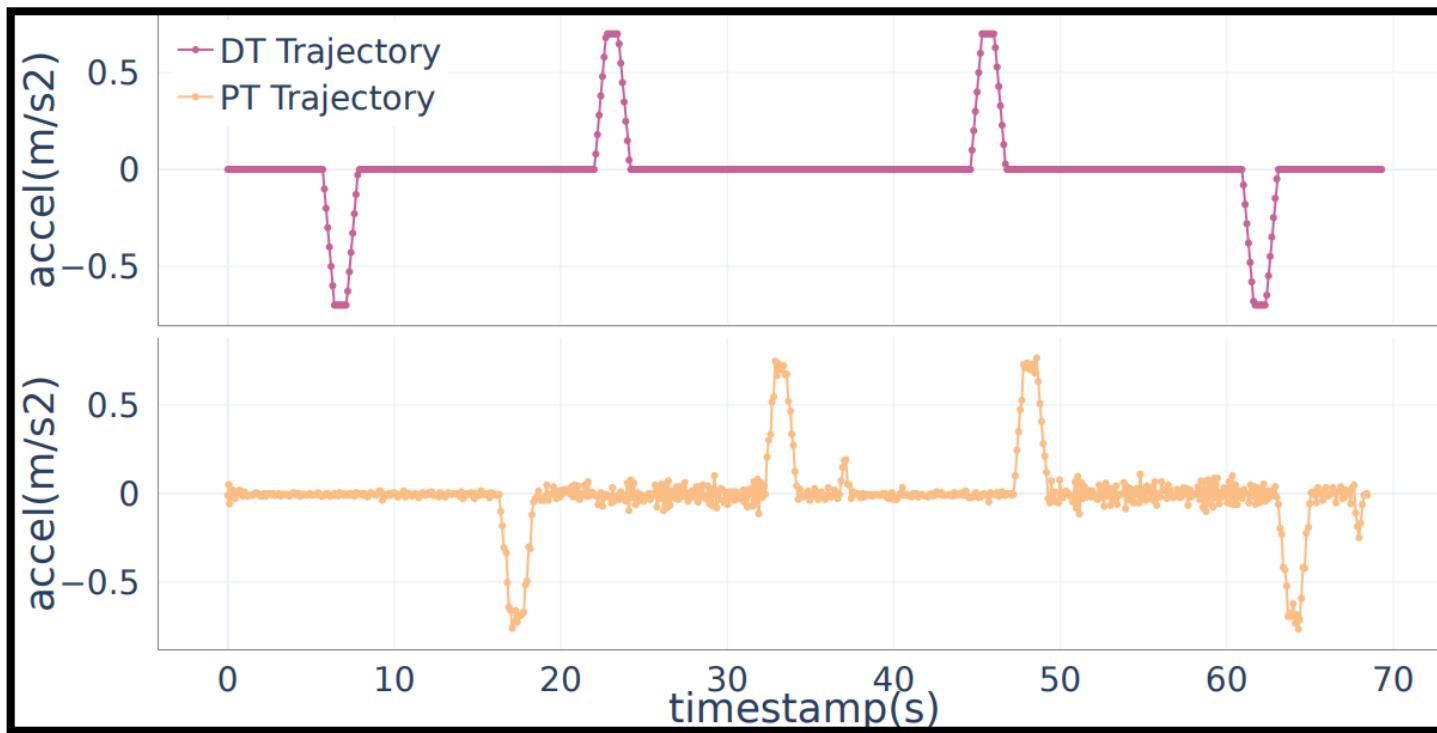

Case Study

Mondragón elevator

Trace alignment for measuring fidelity

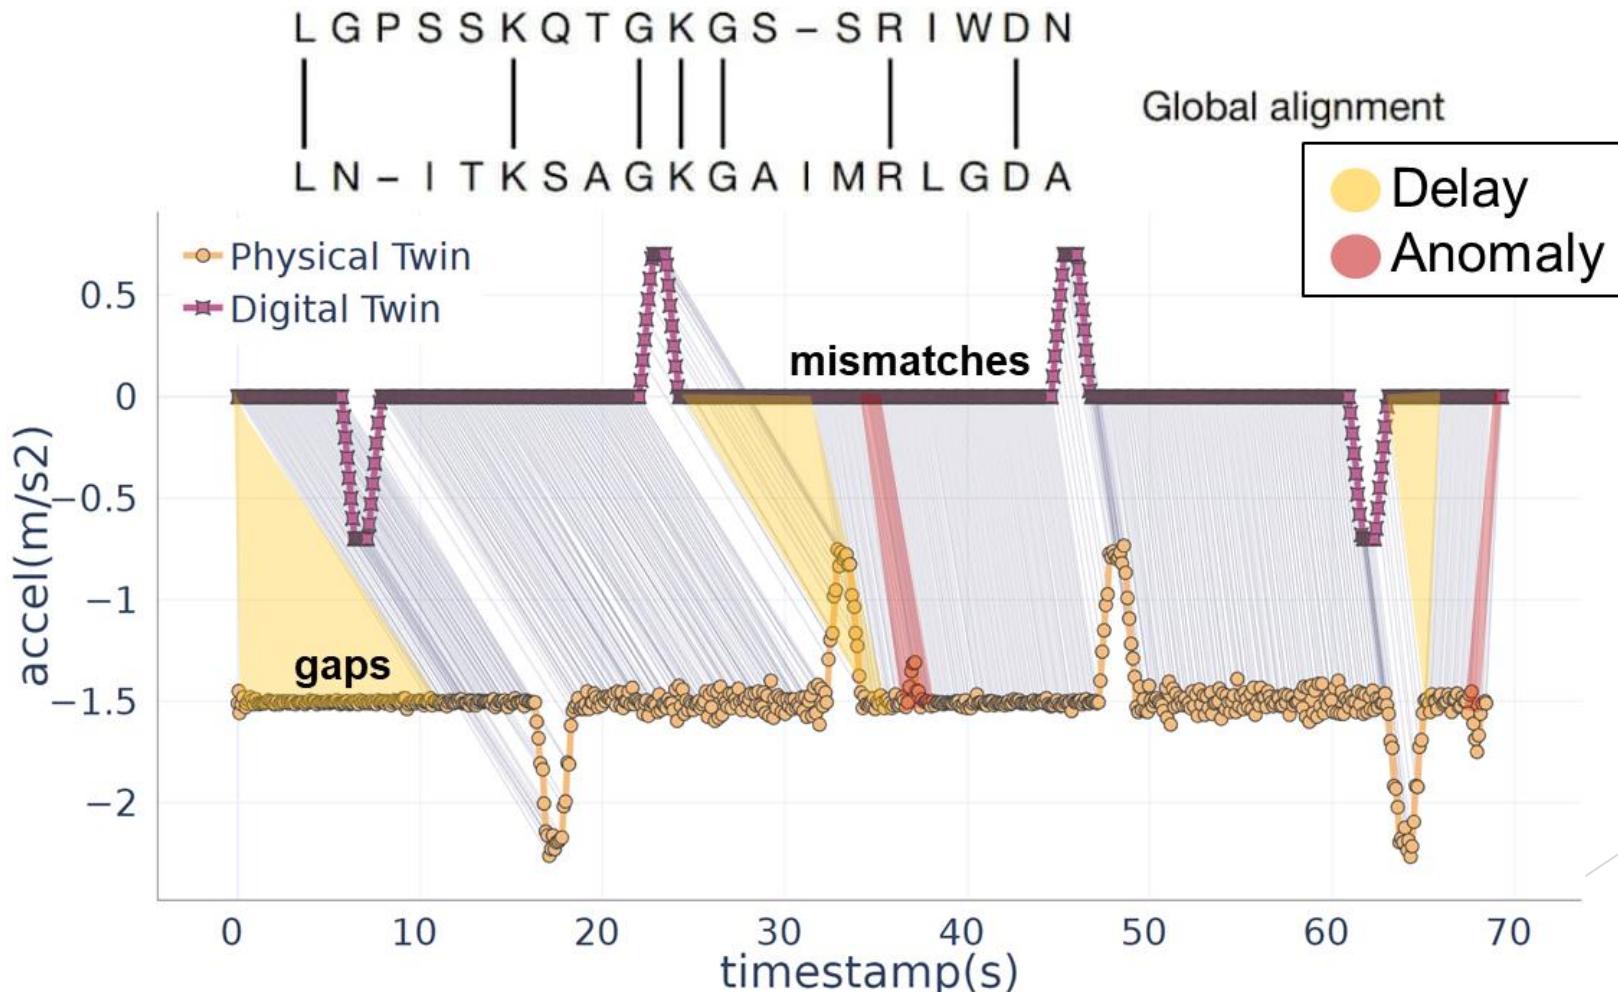

- A trace is a sequence of *snapshots* of the state of each twin

P. Muñoz, M. Wimmer, J. Troya, A. Vallecillo "Measuring the Fidelity of a Physical and a Digital Twin Using Trace Alignments" IEEE Transactions on Software Engineering, Volume 50, Issue 12, 3122-3145, 2024

Sequence alignment

- ▶ Optimized version of the Needleman Wunsch algorithm

Technologies & Platforms

- ▶ Few domain-agnostic proposals
- ▶ Low maturity level
 - ▶ there are no proposals empirically evaluated
- ▶ Lack of a common understanding
 - ▶ about which components a DT should have
 - ▶ at least, agreement on: model, datalake, sync, and services
- ▶ Main components/techniques involved
 - ▶ Mathematical & Physical models, Simulation & Analysis tools, Databases, MDE, CAD & 3D tools,...

M. Dalibor, N. Jansen, B. Rumpe, D. Schmalzing, L. Wachtmeister, M. Wimmer, A. Wortmann. A Cross-Domain Systematic Mapping Study on Software Engineering for Digital Twins, Journal of Systems and Software, vol. 193, 2022, <https://doi.org/10.1016/j.jss.2022.111361>.

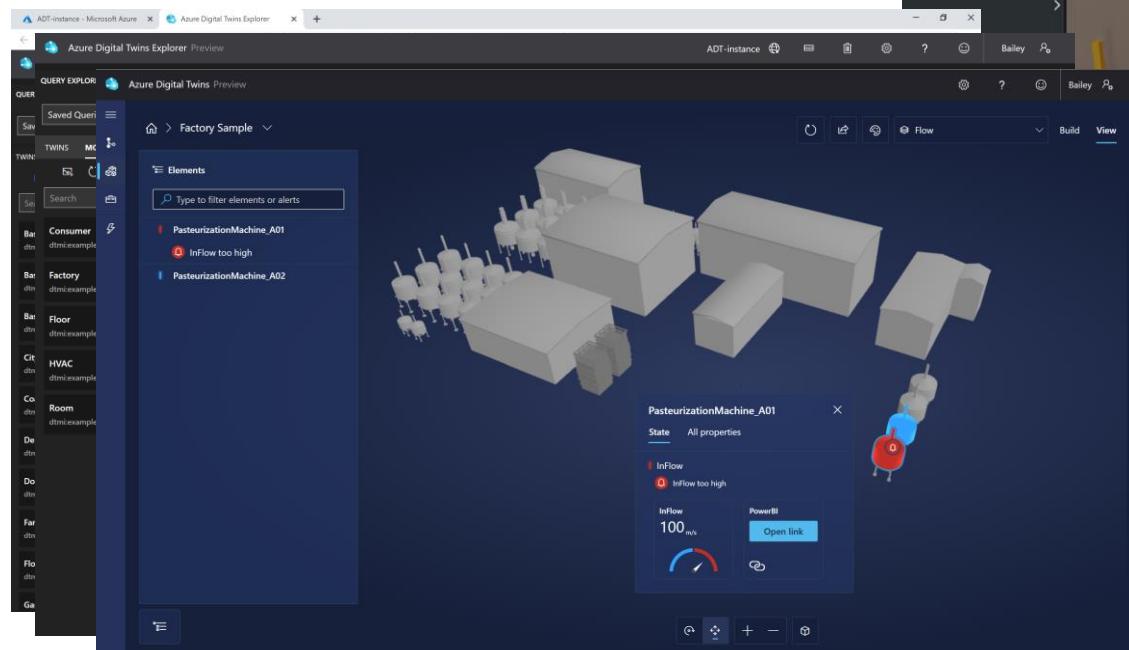

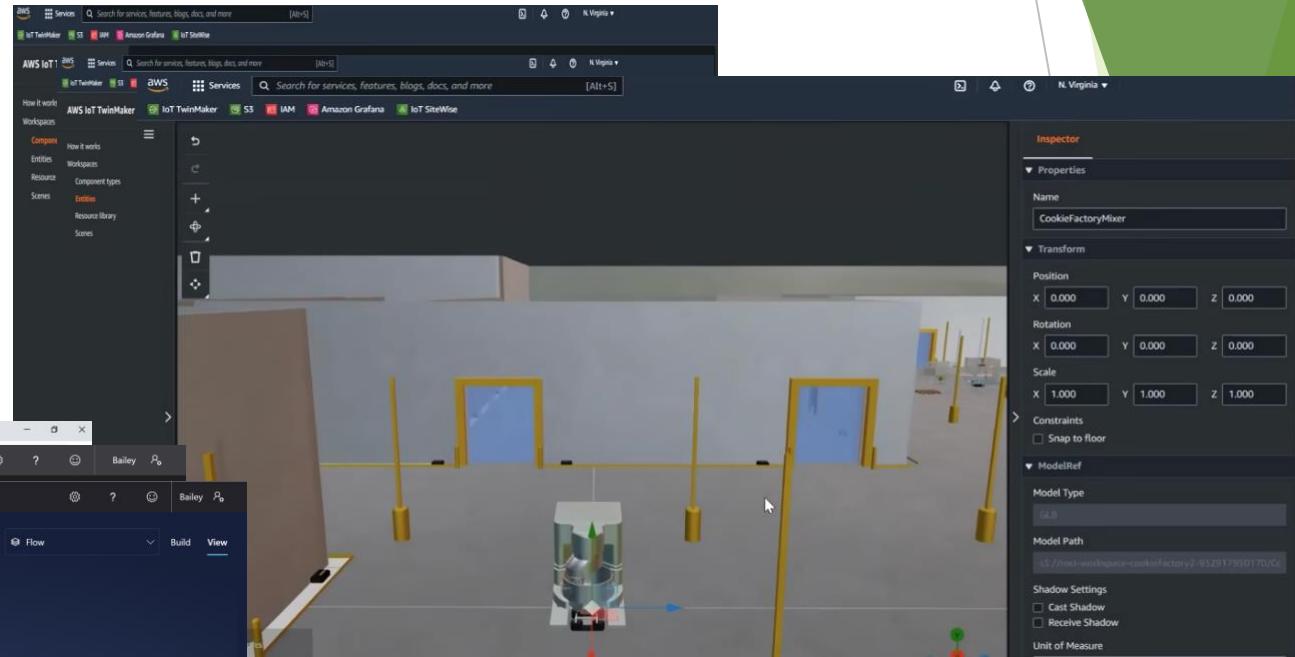

Technologies & Platforms

- ▶ A number of proprietary solutions are available
 - ▶ usually they are domain-oriented.
- ▶ Cloud-based general-purpose platforms
 - ▶ Azure DT, AWS IoT TwinMaker, GCP
- ▶ Lack of open-source frameworks
 - ▶ Fiware
 - ▶ EU-based heavy-weight platform
 - ▶ Eclipse Ditto
 - ▶ basic & most popular DT middleware
 - ▶ OpenTwins
 - ▶ open platform that builds on Ditto

Technologiers & Platforms

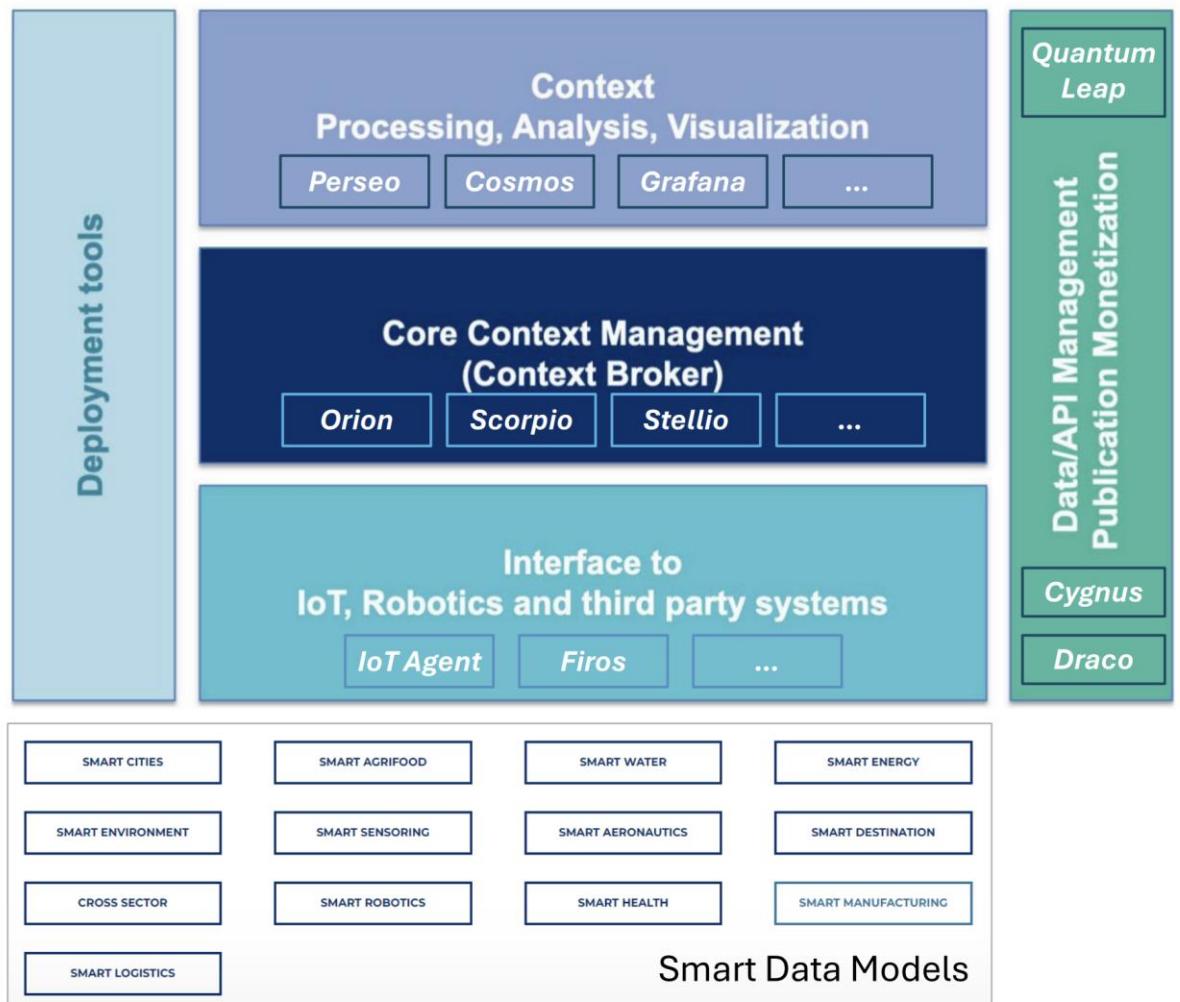

► AWS IoT TwinMaker

► Azure Digital Twins

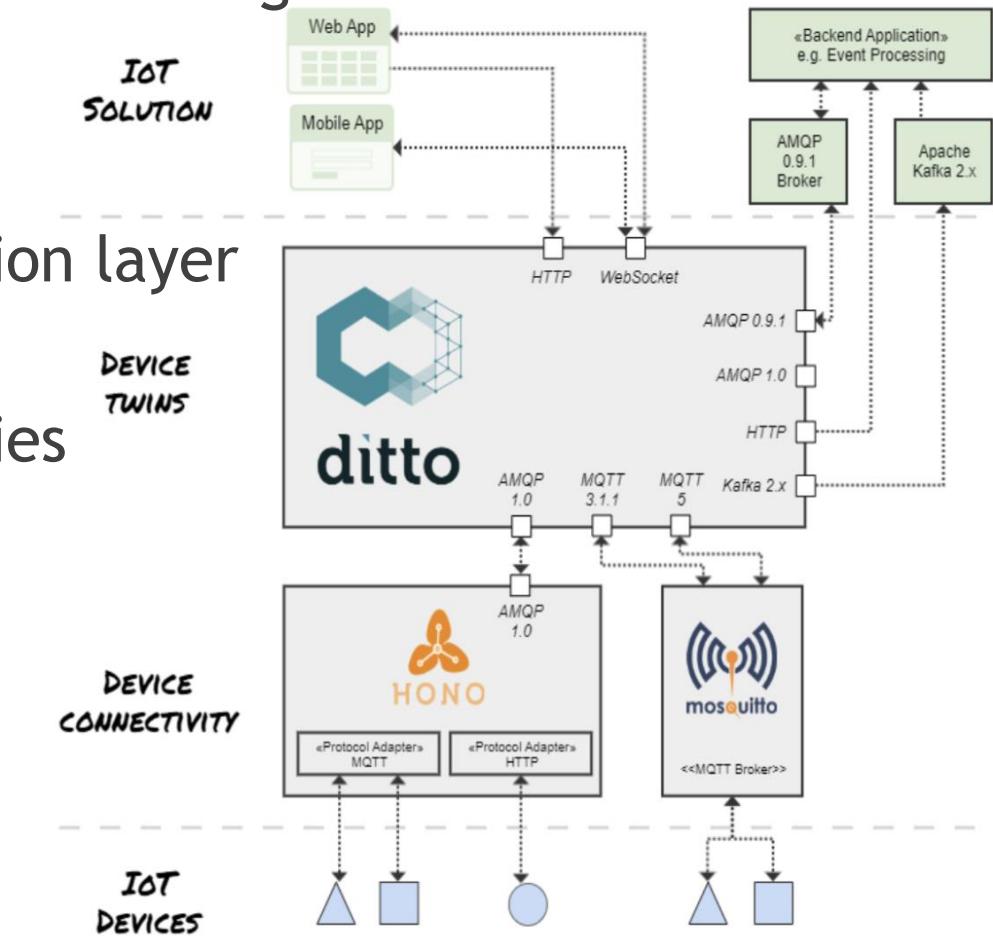

Fiware

- ▶ Open-source ecosystem with components for:
 - ▶ interacting with IoT sensors & devices
 - ▶ vertical integration with other information systems
 - ▶ processing historical and RT data
 - ▶ creating dashboards
 - ▶ KPI monitoring and analysis
 - ▶ visualization
 - ▶ ...

Eclipse Ditto

- ▶ Open-source & domain-agnostic framework for building DTs
- ▶ Offers an abstract layer for working with things in the IoT
- ▶ Integration of devices through a communication layer (Eclipse Hono) or MQTT (Eclipse Mosquitto)
- ▶ Provides state persistence & search capabilities
 - ▶ through a MongoDB-like datalake
- ▶ Accesses things always in an authorized way
- ▶ Gets notified about changes
- ▶ Provides APIs - Device as a Service
- ▶ Integration with other tools & platforms

Eclipse Ditto - Limitations

- ▶ Ditto offers basic functionality for integrating IoT things

```
curl -X PUT -u ditto:ditto \
